

CHANGES AND IMPROVEMENTS FOR 2010

We continue to "tweak" our food plot offerings to offer the best mixes to **attract** and **sustain** your deer population. Our improvements are made as we listen to our member's suggestions according to their observations of DEER on THEIR food plots. We continue to offer our mixes specifically blended by a Wisconsin seed company for Wisconsin Hunters. Our mixes are planted and evaluated by our members before we offer them to you. Our goal is to offer mixes to you that attract and keep deer on your property ALL YEAR. **Uplands Preferred Perennial Mix** (summer thru fall) **Uplands Preferred Brassica Blend** (fall thru winter) **Eagle Forage Soybeans** (spring thru winter)

We have improved our **WISCONSIN UPLANDS PREFERRED PERENNIAL MIX** by making the following changes:

- reduce amount of the Red Clover

- increase the amounts of Ladino Clover and Winter King Alfalfa

We made the above changes to make the mix **more attractant & robust**.

We have improved our **WISCONSIN UPLANDS PREFERRED BRASSICA BLEND** by making the following changes:

- reducing the amount of Swiss Chard

- adding Dwarf Essex Rape

We added the Dwarf Essex Rape to give more variety to our blend.

We continue to maintain the base of this mix as Forage Brassicas, as many members have had a **HUGE SUCCESS** with them.

AGAIN THIS YEAR WE WILL BE OFFERING **EAGLE FORAGE SOYBEANS!!!!!!**

In 2008 we planted experimental plots of Roundup Ready Eagle Forage Soybeans. We were looking for a Soybean that would stay green longer and give the deer more forage. Boy was this ever a winner, it stayed green though October, and generally grew 4 feet tall plus. In most cases the deer browsed the entire field, but could not over browse it due to the blends ability to put on more and more growth. In plots smaller than 1/2 acre or in higher deer densities, we recommend 100% forage beans in the plot. We are suggesting that you plant both Eagle Forage Beans and Field Beans together, to give you the optimum of forage AND bean production in larger plots or in lower deer density areas. The forage from the Eagle Beans will give you forage for the deer from summer through early fall. The bean production will give you feed during the fall and stressful winter.

THE DEER LOVE THEM!!!!!!!!!!
